DETAILED ACTION

Allowable Subject Matter

1. Claims 1 – 31 are allowed.
2. The following is an Examiner's statement of reason for allowance:

The above mentioned claims are allowable over prior arts because the CPA (Cited Prior Art) of record fails to teach or render obvious the claimed limitations in combination with the specific added limitations, as recited in independent claims 1, 11, 18, 25, and subsequent dependent claims.

The CPA does not teach or suggest a system and method of providing adaptive security to a data stream by determining the availability of a number of security processor operations at the receive host, communicating this actual security level from the receive host to the send host, generating a plurality of data packets, having an authentication header including the desired security level range and the actual security level, associated with the data stream in the send host and reallocating computing resources if it is determined that insufficient computing resources are available at the receive host. This new system provides an adaptive security system with a dynamic nature to adapt to bandwidth fluctuations and in situations where computing power is not sufficient.

The present invention addresses the following drawbacks of prior art security mechanisms: 1) overtaxing of system resources at hosts lacking the computing power

to process the stream and accompanying security, resulting in loss of data and some measure of security, 2) the lack of quick adaptability to bandwidth fluctuations without the loss of security level or data, and 3) lack of adaptability at the host when computing power is not sufficient to handle the data stream and the security level.

Thus this invention provides a method for communicating and applying adaptive security to a data stream comprising a plurality of data packets. This method comprises identifying a desired security level range and a desired actual security level which falls within the desired security level for the data stream to be received by a host, determining the availability of a number of security processor operations at the host, reallocating computing resources at the host if the data stream cannot be verified at the desired security level, reallocating communication resources if there are insufficient computing resources available for reallocation at the host, and verifying the data packets at the actual security level, the actual security being within the desired security level range. This method allows for the dynamic lowering or raising of the actual security level based on the number of available security processor operations per second (SOPS) available in the receive host, and allows for reverting back to the desired security level parameters once/if the SOPS become available.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
